The Sabanana Project

Table of Content

1. Home

By Kazi Ahmed
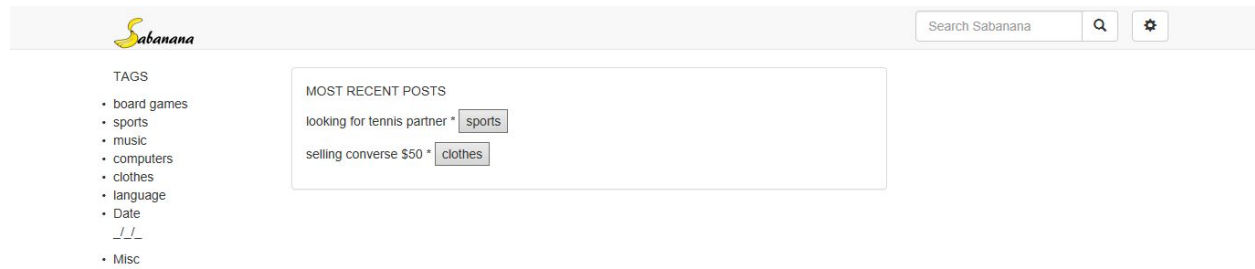

This is a screenshot of the page for the home screen. The left sidebar has tags which a user can use to find posts based on their categories or the date the post was posted. The main feed has the most recent posts on Sabanana along with buttons to their tag so people can see other posts in the most recent posts' category. The right sidebar has the option for the user to add a post whenever the user wants to add a post. The top right contains the search box for the user to search for posts and a settings button so the user can change his/her settings.

2 User Profile
By Saul Shanabrook

On the User Profile page, a user can view any user's information and all their posts. You will see their name, photo, and a description on the left. On the right, there is a list of their posts, along with the tags of each post. Clicking on any of the tags will take you to just filtering on that tag. Also click on the post will take you to that post.
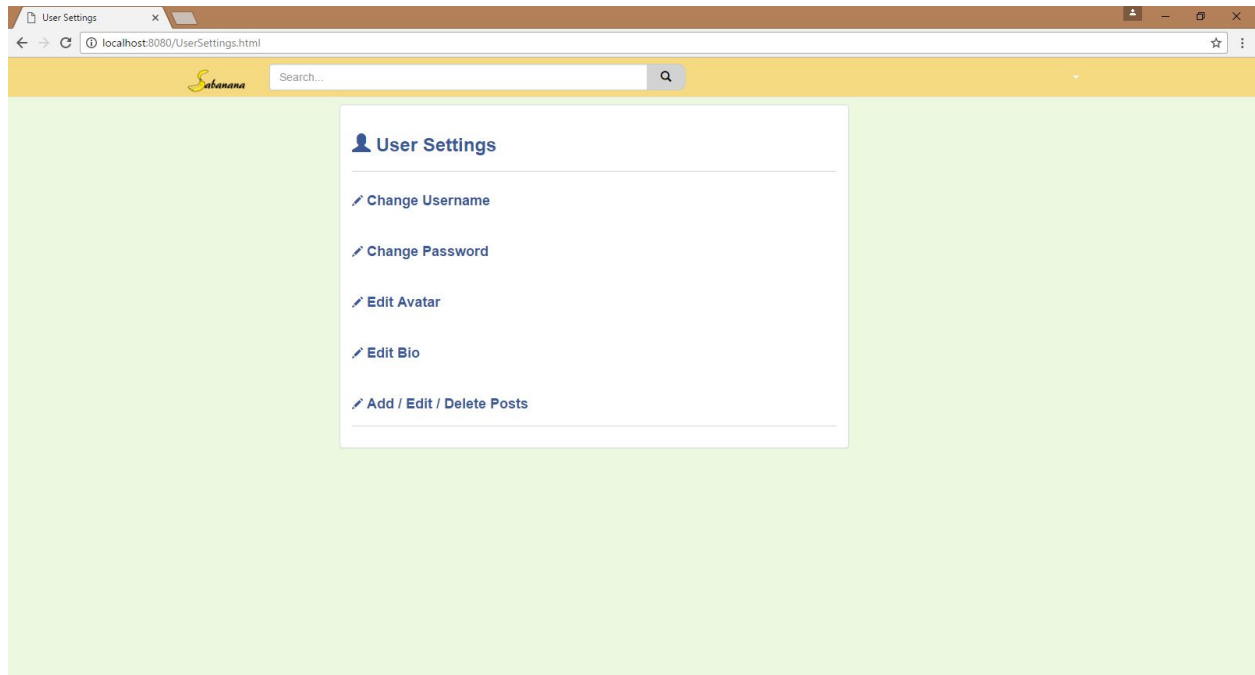

3
By Evan Busha
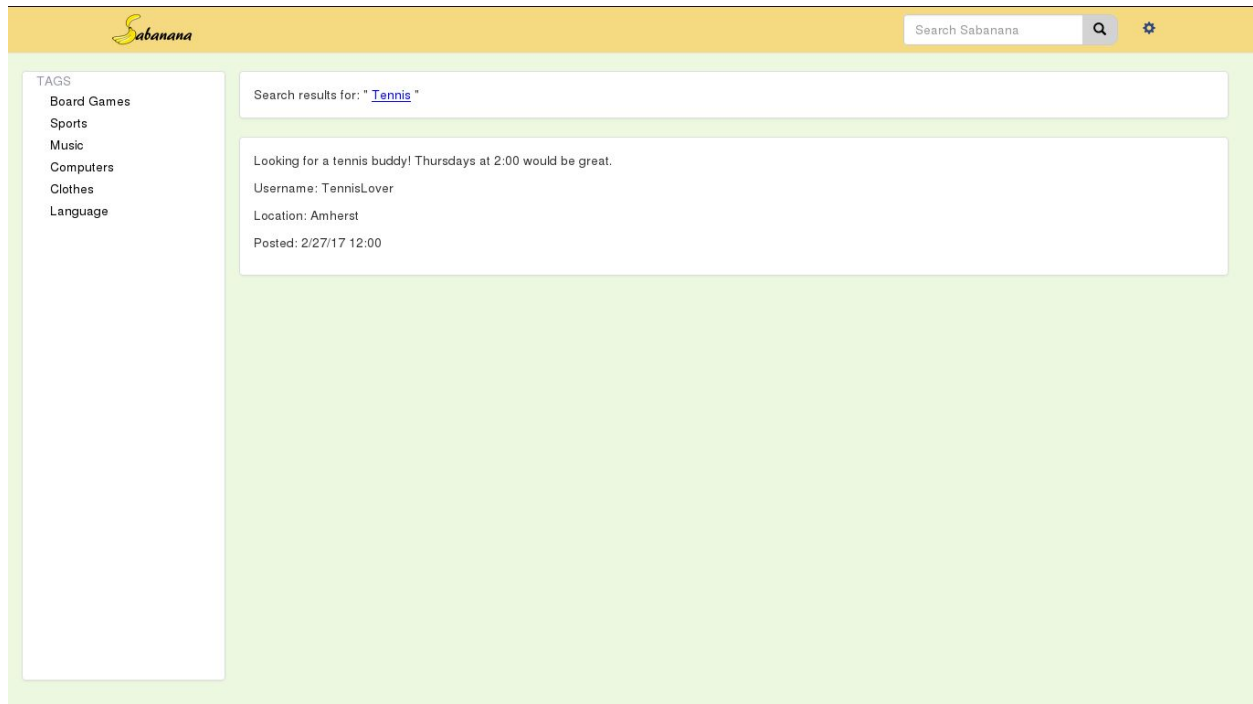

This is the search results page. Here, posts will be shown according to keywords, and they can be further filtered by the tags on the left. Clicking on a post will bring you to that post.

4 User Settings

By Hana

This is a screenshot of the User Settings pages. This is where the User can change any personal information such as their username, password, avatar, or bio. They may also add, edit or delete posts. If you click on each option it should open a small window on the page for you to do the action you clicked on. The Add/Edit/Delete Posts should send you to your page with the list of posts you have posted.
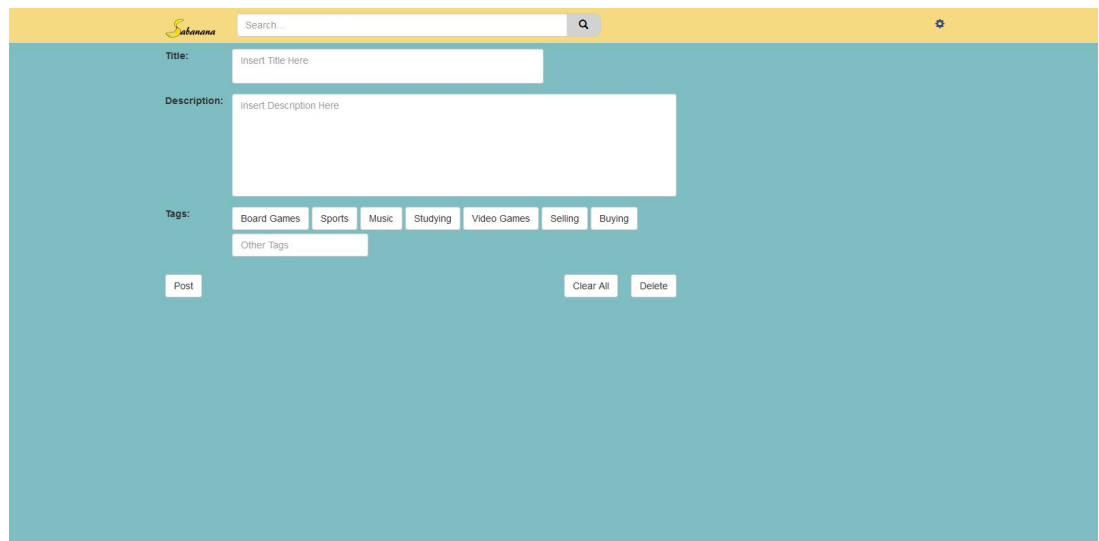

5. Messaging

By Jon
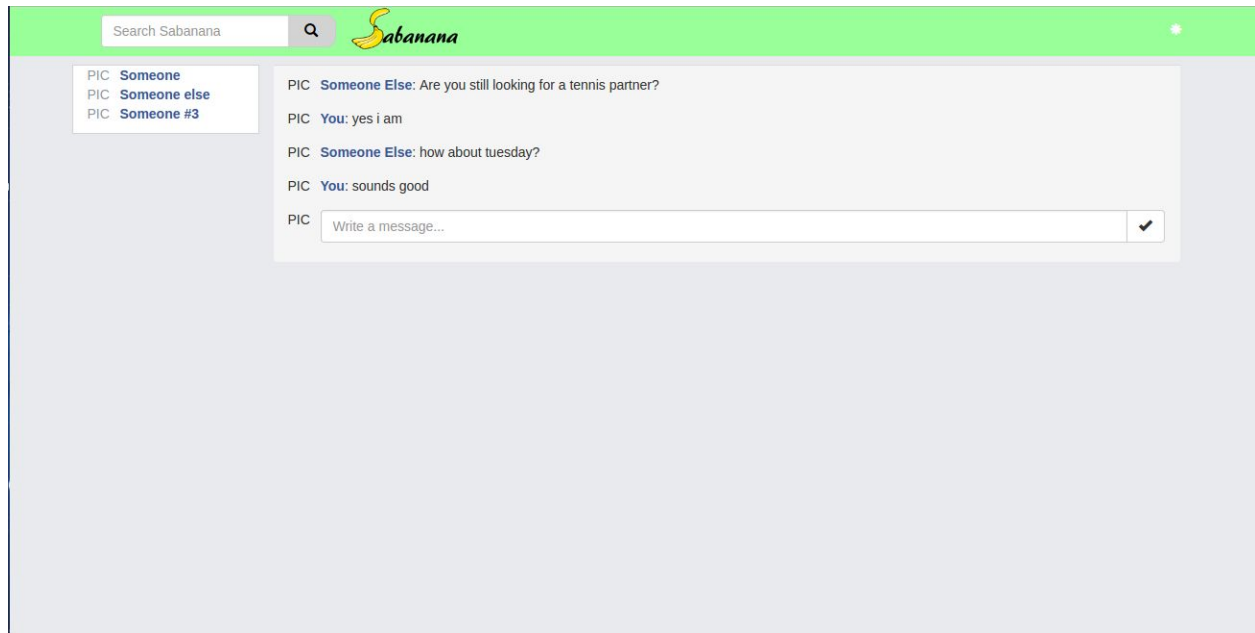

This is a screenshot of the page for sending and receiving messages. On the left is a list of users you have been in contact with that you can select. It will have a small version of their avatar pictures next to their name. The main area is populated with the messages of the selected person. At the bottom of the main area will be the text area to write the messages.
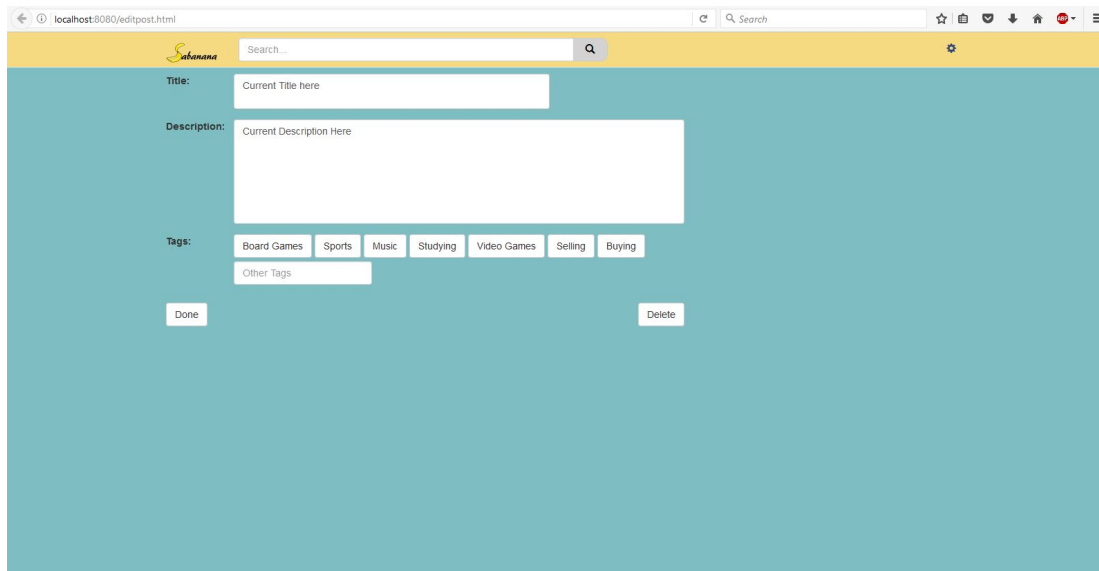

6: Create/Edit Post

By Huy Nguyen

This is a screenshot of the page that is going to be used to add a post to the system, and once a post is finished, we plan to have a small box that

pops up, and confirms that the post has been uploaded to the system. It will then transition the user to the Home page. There is a clear all button so it will be easier for the user to clear all of the information on the page without having to refresh the page, or unclick ever tag already clicked.

This screenshot is the screen, which the user will edit the page, and it should be similar to the create screen page, but with a few modifications, with the page already having

the text of the title and description in it, and the tag buttons already being highlighted, but due to the lack of knowledge of Javascript, this could not be accomplished yet.

7. Display Post

By Avery Samuel
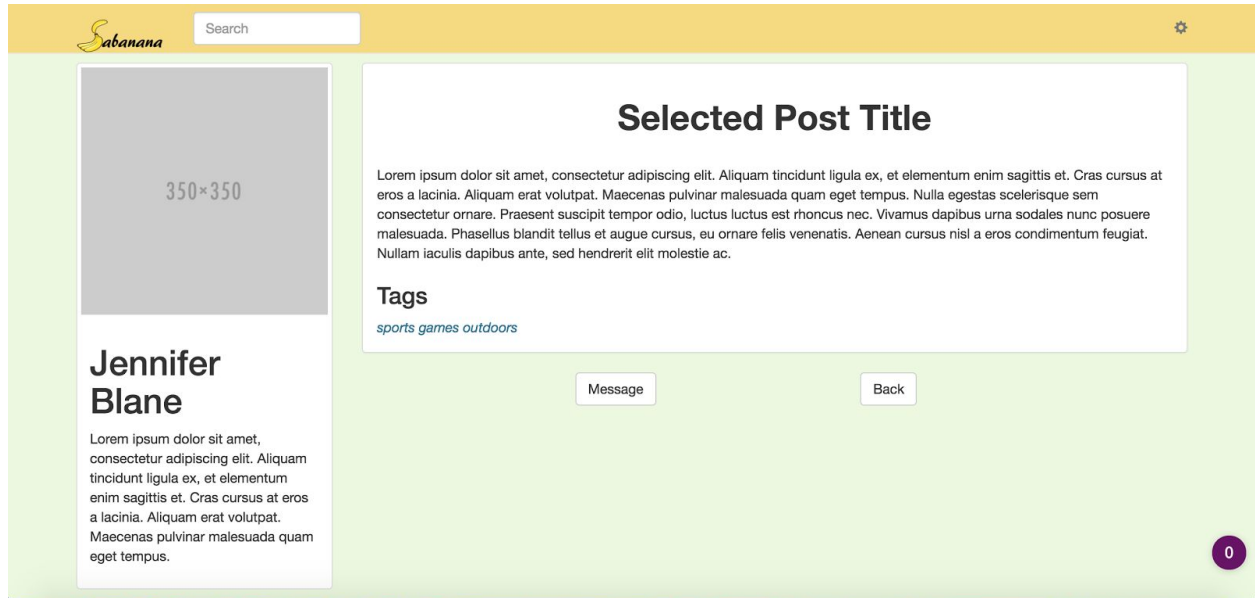

Here's the screen which will pop up when you click on a post that you find interesting on the main screen. The Name/Bio of the user who posted will come up, as well as a more detailed view of the post including the title, entire description, and the tags. You will have the option to either message the person who posted, or go back to the home screen and continue looking through posts. You can also use the search bar to start an entirely new search from this page.
